

R4 for the slashed K33

May-11-10
9:19 AM

Plan: 1. show that the closure does not depend
 or maybe, partition to $(n-1, 1)$ and show cyclic invariance. } on the partition of the legs into two sets, "up" and "down".

2. Show good behaviour under the disjoint union of tangles.

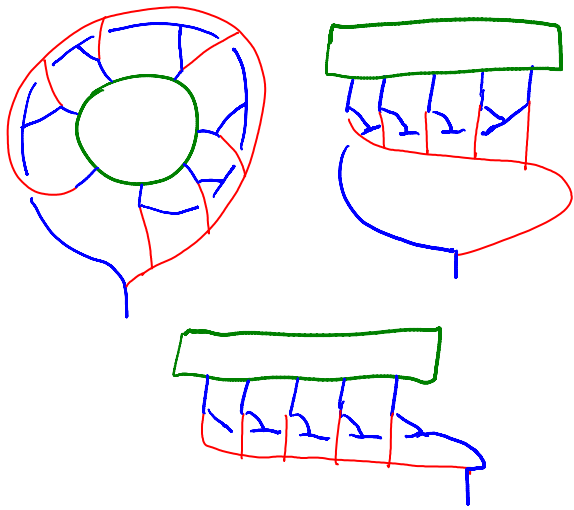

3. Show good behaviour under the unary contraction of adjacent legs.

Fails because we don't have move 8.

"the lung"

Cyclic invariance
 Seems easy, assuming
 the result is indep. of
 the choice of the drainage
 trees.

"Strangling and slashing go further than the guillotine". X

(In PC talk - "Compression and puncturing go further than strand deletion".) X
