

Facts and Dreams About v-Knots and Etingof-Kazhdan, 1

Dror Bar-Natan at Swiss Knots 2011

<http://www.math.toronto.edu/~drorbn/Talks/SwissKnots-1106/>

Abstract. I will describe, to the best of my understanding, the relationship between virtual knots and the Etingof-Kazhdan quantization of Lie bialgebras, and explain why, IMHO, both topologists and algebraists should care. I am not happy yet about the state of my understanding of the subject but I haven't lost hope of achieving happiness, one day.

Abstract Generalities. (K, I) : an algebra and an "augmentation ideal" in it. $\hat{K} := \varprojlim K/I^m$ the " I -adic completion". $\text{gr}_I K := \widehat{\bigoplus} I^m/I^{m+1}$ has a product μ , especially, $\mu_{11}: (C = I/I^2)^{\otimes 2} \rightarrow I^2/I^3$. The "quadratic approximation" $\mathcal{A}_I(K) := \widehat{FC}/(\ker \mu_{11})$ of K subjects using μ on $\text{gr } K$.

Peter Lee

The Prized Object. A "homomorphic \mathcal{A} -expansion": a homomorphic filtered $Z: K \rightarrow \mathcal{A}$ inducing the identity on $I/I^2 = C$.

Dror's Dream. All interesting graded objects and equations, especially those around quantum groups, arise this way.

Example 2. For $K = \mathbb{Q}PvB_n =$ "braids when you look", [Lee] shows that a non-homomorphic Z exists. [BEER]: there is no homomorphic one.

General Algebraic Structures!

- Has kinds, elements, operations, and maybe constants.
- Must have "the free structure over some generators".
- We always allow formal linear combinations.

All still works!

Example 3. Quandle: a set K with an op \wedge s.t.

$1 \wedge x = 1, \quad x \wedge 1 = x = x \wedge x, \quad (\text{appetizers})$
 $(x \wedge y) \wedge z = (x \wedge z) \wedge (y \wedge z), \quad (\text{main})$

$\mathcal{A}(K)$ is a graded Lie algebra: Roughly, set $\bar{v} := (v-1)$ (these generate $I!$), feed $1 + \bar{x}, 1 + \bar{y}, 1 + \bar{z}$ in (main), collect the surviving terms of lowest degree:

$(\bar{x} \wedge \bar{y}) \wedge \bar{z} = (\bar{x} \wedge \bar{z}) \wedge \bar{y} + \bar{x} \wedge (\bar{y} \wedge \bar{z}).$

Example 4. Parenthesized braids make a category with some extra operations. An expansion is the same thing as an associator, and the Grothendieck-Teichmuller story² arises naturally.

Drinfel'd

Example 1.

T. Kohno

$K = \left\langle \begin{array}{c} \text{braids} \\ \text{with crossings} \end{array} \right\rangle \quad I = \left\langle \begin{array}{c} \text{crossing} \\ = \text{difference of crossings} \end{array} \right\rangle$

$(K/I^{m+1})^* = (\text{invariants of type } m) =: \mathcal{V}_m$

$(I^m/I^{m+1})^* = \mathcal{V}_m/\mathcal{V}_{m-1} \quad C = \langle t^{ij} | t^{ij} = t^{ji} \rangle = \langle \text{HHH} \rangle$

$\ker \mu_{11} = \langle [t^{ij}, t^{kl}] = 0 = [t^{ij}, t^{ik} + t^{jk}] \rangle = \langle 4T \text{ relations} \rangle$

$\mathcal{A} = \left(\begin{array}{c} \text{horizontal chord dia-} \\ \text{grams mod } 4T \end{array} \right) = \langle \text{HHH} \rangle / 4T$

Z : universal finite type invariant, the Kontsevich integral.

Why Prized? Sizes K and shows it "as big" as \mathcal{A} ; reduces "topological" questions to quadratic algebra questions; gives life and meaning to questions in graded algebra; universalizes those more than "universal enveloping algebras" and allows for richer quotients.

Bring KTG's from Montpellier.

 $W-1$ ✓

$W-2$ ✓

To Do.

- Example: KTGs and non-horizontal associators. ("bracket rise" arises here).
- Example: wKO's and the Kashiwara-Vergne equations.
- vKO's, bi-algebras, E-K, what would it mean to find an expansion, why I care (stronger invariant, more interesting quotients).
- wKO's, uKO's, and Alekseev-Enriquez-Torossian.

Footnotes and references are on the PDF version, page 3.

"God created the knots, all else in topology is the work of mortals."
 Leopold Kronecker (modified)

Footnotes

1. I probably mean “a functor from some fixed “structure multi-category” to the multi-category of sets, extended to formal linear combinations”.
2. See my paper [BN1] and my talk/handout/video [BN2].
