

The Problem. Let $G = \langle g_1, \dots, g_\alpha \rangle$ be a subgroup of S_n , with $n = O(100)$. Before you die, understand G :

1. Compute $|G|$.
2. Given $\sigma \in S_n$, decide if $\sigma \in G$.
3. Write a $\sigma \in G$ in terms of g_1, \dots, g_α .
4. Produce *random* elements of G .

The Commutative Analog. Let $V = \text{span}(v_1, \dots, v_\alpha)$ be a subspace of \mathbb{R}^n . Before you die, understand V .

Solution: Gaussian Elimination. Prepare an empty table,

1	2	3	4	...	n-1	n
---	---	---	---	-----	-----	---

Space for a vector $u_4 \in V$, of the form $u_4 = (0, 0, 0, 1, *, \dots, *)$; 1 := "the pivot"

Feed v_1, \dots, v_α in order. To feed a non-zero v , find its pivotal position i .

1. If box i is empty, put v there.
2. If box i is occupied, find a combination v' of v and u_i that eliminates the pivot, and feed v' .

Non-Commutative Gaussian Elimination
Prepare a mostly-empty table,

(1,1)						
(1,2)	(2,2)					
(1,3)	(2,3)	(3,3)				
			(i,j)			
(1,n)	(2,n)	(3,n)			(n,n)	

Space for a $\sigma_{i,j} \in S_n$ of the form $(1, 2, \dots, i-2, i-1, j, *, \dots, *)$
So $\sigma_{i,j}$ fixes $1, \dots, i-1$, sends "the pivot" i to j and goes wild afterwards, and $\sigma_{i,j}^{-1}$ "does sticker j ".

Feed g_1, \dots, g_α in order. To feed a non-identity σ , find its pivotal position i and let $j := \sigma(i)$. *write*

1. If box (i, j) is empty, ~~put~~ σ there.
2. If box (i, j) contains $\sigma_{i,j}$, feed $\sigma' := \sigma_{i,j}^{-1} \sigma$.

The Twist. When done, for every occupied (i, j) and (k, l) , feed $\sigma_{i,j} \sigma_{k,l}$. Repeat until the table stops changing.

Claim 1. The process stops in our lifetimes, after at most $O(n^6)$ operations. Call the resulting table T .

Claim 2. Every $\sigma_{i,j}$ in T is in G .

Claim 3. Anything fed in T is now a monotone product in T : f was fed $\Rightarrow f \in M_1 := \{\sigma_{1,j_1} \sigma_{2,j_2} \dots \sigma_{n,j_n} : \forall i, j_i \geq i \ \& \ \sigma_{i,j_i} \in T\}$

Homework Problem 1. Can you do cosets?

Homework Problem 2. Can you do categories (groupoids)?

Non-Commutative Gaussian Elimination and Rubik's Cube

The Generators

$n = 54$;

$g_1 = \text{Cycles}(\{(1, 18, 45, 28), (2, 27, 44, 19), (3, 36, 43, 10), (46, 52, 54, 48), (47, 49, 53, 51)\})$;

$g_2 = \text{Cycles}(\{(7, 16, 39, 30), (8, 25, 38, 23), (9, 34, 37, 12), (13, 15, 33, 31), (14, 24, 32, 22)\})$;

$g_3 = \text{Cycles}(\{(28, 31, 34, 48), (29, 32, 35, 47), (30, 33, 36, 46), (37, 39, 45, 43), (38, 42, 44, 40)\})$;

$g_4 = \text{Cycles}(\{(1, 3, 9, 7), (2, 6, 8, 4), (10, 54, 16, 13), (11, 53, 17, 14), (12, 52, 18, 15)\})$;

$g_5 = \text{Cycles}(\{(1, 13, 37, 46), (4, 22, 40, 49), (7, 31, 43, 52), (10, 12, 30, 28), (13, 21, 29, 33)\})$;

$g_6 = \text{Cycles}(\{(3, 48, 39, 15), (6, 51, 42, 24), (9, 54, 45, 33), (16, 18, 36, 34), (17, 27, 35, 25)\})$;

Claim 4. If two monotone products are equal, $\sigma_{1,j_1} \dots \sigma_{n,j_n} = \sigma_{1,j'_1} \dots \sigma_{n,j'_n}$, then all the indices that appear in them are equal, $\forall i, j_i = j'_i$. *Main Lemma*

Claim 5. Let M_k denote the set of monotone products in T starting in column k : $M_k := \{\sigma_{k,j_k} \dots \sigma_{n,j_n} : \forall i \geq k, j_i \geq i \ \& \ \sigma_{i,j_i} \in T\}$. then for every k , $M_k M_k \subset M_k$ (and so each M_k is a subgroup of G).

Proof. By backwards induction. Clearly $M_n M_n \subset M_n$. Now assume that $M_5 M_5 \subset M_5$ and show that $M_4 M_4 \subset M_4$. Start with $\sigma_{8,j} M_4 \subset M_4$:

$$\sigma_{8,j} M_4 \subset \bigcup_j \sigma_{8,j} M_5 \stackrel{1}{=} \bigcup_j \sigma_{8,j} \sigma_{4,j} M_5 \stackrel{2}{=} M_4 M_5$$

$$\stackrel{3}{=} \bigcup_j \sigma_{4,j} M_5 \stackrel{4}{=} M_4$$

(1: associativity, 2: thank the twist, 3: *idea* associativity and tracing, 4: induction). Now the general case $(\sigma_{4,j'_1} \sigma_{5,j'_2} \dots)(\sigma_{4,j_1} \sigma_{5,j_2} \dots)$ falls like a chain of dominos.

Theorem. $G = M_1$ and we have achieved our goals.

A Demo Program

```

sigma_o_tau := PermutationProduct[tau, sigma];
Feed[Cycles[{}]] := Null;
Feed[tau_] := Module[{i, j, k, l},
  i = Min[PermutationSupport[tau]];
  j = PermutationReplace[i, tau];
  If[Head[tau_{i,j}] == Cycles,
    Feed[InversePermutation[tau_{i,j} o tau],
    (*Else*) tau_{i,j} = tau;
  For[k = 1, k < n, ++k,
    For[l = k + 1, l <= n, ++l,
      If[Head[tau_{k,l}] == Cycles,
        Feed[tau_{i,j} o tau_{k,l}]; Feed[tau_{k,l} o tau_{i,j}]]
    ]
  ]];
RecursionLimit = infinity;
    
```

change to match with program

Swap.

that's cool!
