RBs/Thurston D

SW: $A \otimes A^* \rightarrow A^* \otimes A$:

$R = \sum \psi_i a_i$

$\psi_2 b_2 \langle b_1, \psi_1 \rangle \langle b_3, \psi_3 \rangle$

$\langle a_1, \psi_1 \rangle \langle a_2, \psi_2 \rangle \langle a_3, \psi_3 \rangle$

claim used: $\langle b, \psi \rangle = \sum \langle b, \psi_i \rangle \langle a_i, \psi \rangle$

well-definedness:

$b \cdot \psi = \psi_2 b_2 \langle b_1, \psi_1 \rangle \langle b_3, \psi_3 \rangle$ (a variant of the above)

claim This is a degree non-decreasing operation.

Aside Is it obvious that

$\langle b_1, \psi_1 \rangle \langle b_2, \psi_2 \rangle = \eta(b) \eta(\psi)$?

Indeed,

$$\text{lhs} = \langle b, \psi_1, \psi_2 \rangle = \langle b, \psi_2, \psi_1 \rangle \quad \square$$

$$bc \cdot \psi = \psi_2 b_2 c_2 \langle b_1, c_1, \psi_1 \rangle \langle b_3, c_3, \psi_3 \rangle$$

$$= \psi_3 b_2 c_2 \langle b_1, \psi_1 \rangle \langle c_1, \psi_2 \rangle \langle b_3, \psi_3 \rangle \langle c_3, \psi_4 \rangle$$
