Recall the double multiplication was defined as:

```

Define [
  dmi,j→k = ( (sYi→4,4,1,1 // aΔ1→1,2 // aΔ2→2,3 // aS3) (sYj→-1,-1,-4,-4 // bΔ-1→-1,-2 // bΔ-2→-2,-3) ) //
  (P-1,3 P-3,1 am2,-4→k bm4,-2→k) ]
    
```

The essential bit that is hard to justify due to the cancellation of terms $\frac{1}{h}$ is this:

$$\text{In[*]:= EssentialBit} = \mathbf{a}\Delta_{i \rightarrow 1,2} // \mathbf{a}\Delta_{2 \rightarrow k,3} // \overline{\mathbf{a}S_3} \mathbf{b}\Delta_{j \rightarrow -1,-2} // \mathbf{b}\Delta_{-2 \rightarrow 1,-3} // (\mathbf{P}_{-1,3} \mathbf{P}_{-3,1})$$

Rewriting it step by step using the definition of Δ to move all pairings to the left and all R-matrices to the right we see the essential bit is the dual of something simpler, let's call that the core.
