

Pensieve header: This is the main notebook for the nb2tex project, containing both the documentation and the implementation.

To do

The phrase “ $\wedge$ FreeQ[c, _Cell, {1, ∞ }]” within the program seems unnecessary, and is presently commented out. Remove or justify!

Insert definitions for \nbpdfPrint and for \nbpdfText.

Experimentation

```

\begin{document}

```

The nb2tex project aims to write a converter that takes Mathematica notebooks and converts them into latex files.

Text cells with tag ``tex'' becoame verbatim tex output. They may include anything texish --- like formulas $\$1+1=2\$$, or anything else.

Untagged cells are ignored; for example, the following one should not appear in the latex result:

Cells with tag ``pdf'' are converted into numbered pdf files in a pdf-subfolder (default name: same as the notebook's name; in this case, ``Sample''). The latex produced is `\verb$\nbpdfType{Sample/nnn.pdf}$`, where `\verb$Type$` is the type of the current cell (`\verb$Text$`, `\verb$Input$`, `\verb$Output$`, `\verb$Echo$`, etc.), and `\verb$nnn$` is the number of the current pdf file.

For example:

```

\noindent\nbpdfInput{Sample/1.pdf}

\noindent\nbpdfEcho{Sample/2.pdf}

\noindent\nbpdfOutput{Sample/3.pdf}

\noindent\nbpdfInput{Sample/4.pdf}

\noindent\nbpdfOutput{Sample/5.pdf}

```

If a tag is of the form ``pdfXXX'', the string XXX gets added to the `\verb$\nbpdf$` command, so it becomes `\verb$\nbpdfXXXType$`. This is useful for graphics inclusions, for example, where a useful tag would be ``pdfgraph'':

```

\noindent\nbpdfgraphInput{Sample/6.pdf}

\noindent\nbpdfgraphOutput{Sample/7.pdf}

```

Invoking nb2tex (suffixes are automatically added and should not be included):

```

\noindent\nbpdfInput{Sample/8.pdf}

```

Valid options include:

```

\begin{itemize}

```

```
\item \verb$"PDFFolder" -> foldername$ (a string).
\item \verb$"PDFWidth" -> width$ (in inches).
\end{itemize}
```

Text cells with tag ``exec'' get executed using `\verb$ToExpression$` at the time of their processing, with no output produced. This is useful for setting / re-setting options within the notebook itself. For example, a text cell with tag `exec` and content `\verb"nb2tex$PDFWidth=10"` will allow very wide outputs:

```
\noindent\nbpdfgraphInput{Sample/9.pdf}

\noindent\nbpdfgraphOutput{Sample/10.pdf}

\end{document}

\noindent\nbpdfInput{Sample/11.pdf}
```

pdf

Documentation

tex

The nb2tex project aims to write a converter that takes Mathematica notebooks and converts them into latex files.

Text cells with tag ``tex'' become verbatim tex output. They may include anything texish --- like formu-

```
(Alt) In[ ]:=
pdf:Factorial
```

20 !

```
(Alt) Out[ ]:=
pdf:Factorial
```

2 432 902 008 176 640 000

```
tex
```

\par If a tag is of the form ``pdfXXX'', with XXX a string not beginning with the character ``:', the string XXX gets added to the \verb\$\nbpdf\$ command, so it becomes \verb\$\nbpdfXXXType\$. This is useful for graphics inclusions, for example, where a useful tag would be ``pdfgraph'':

```
pdfgraph
```

```
In[ ]:= plot = Plot3D[Cos[x^2 + y^2], {x, -3, 3}, {y, -3, 3}]
```

```
Out[ ]:=
pdfgraph
```

```
tex
```

\par Invoking nb2tex (suffixes are automatically added and should not be included):

```
pdf
```

```
nb2tex[nb_String, opts___Rule];
nb2tex[nb_String, tex_String, opts___Rule];
```

```
tex
```

\par Valid options include:

\begin{itemize}

\item \verb\$"PDFFolder" -> foldername\$ (a string).

\item \verb\$"PDFWidth" -> width\$ (in inches).

\end{itemize}

Input cells with tag ``exec'' get executed using \verb\$ToExpression\$ at the time of their processing (even if they do not have the property ``Evaluable'), with no output produced. This is useful for setting / re-setting options within the notebook itself. For example, an input cell with tag exec and content \verb\$nb2tex\$PDFWidth=10'' will allow very wide outputs:

exec

`In[ ]:= nb2tex$PDFWidth = 10`

tex

`\needspace{25mm}`

pdf

`In[ ]:= binom`

Out[]:=

pdf

$$\begin{aligned}
 &a^{32} + 32 a^{31} b + 496 a^{30} b^2 + 4960 a^{29} b^3 + 35960 a^{28} b^4 + 201376 a^{27} b^5 + 906192 a^{26} b^6 + 3365856 a^{25} b^7 + \\
 &10518300 a^{24} b^8 + 28048800 a^{23} b^9 + 64512240 a^{22} b^{10} + 129024480 a^{21} b^{11} + 225792840 a^{20} b^{12} + \\
 &347373600 a^{19} b^{13} + 471435600 a^{18} b^{14} + 565722720 a^{17} b^{15} + 601080390 a^{16} b^{16} + \\
 &565722720 a^{15} b^{17} + 471435600 a^{14} b^{18} + 347373600 a^{13} b^{19} + 225792840 a^{12} b^{20} + \\
 &129024480 a^{11} b^{21} + 64512240 a^{10} b^{22} + 28048800 a^9 b^{23} + 10518300 a^8 b^{24} + 3365856 a^7 b^{25} + \\
 &906192 a^6 b^{26} + 201376 a^5 b^{27} + 35960 a^4 b^{28} + 4960 a^3 b^{29} + 496 a^2 b^{30} + 32 a b^{31} + b^{32}
 \end{aligned}$$

exec

`nb2tex$PDFWidth = 6.5`

tex

`\par` Similarly, changing `\verb"nb2tex$TeXFileName"` will change the file where the latex output is written.

pdf

Implementation
